Pictures & Perspectives

Demodex Clusters
A 66-year-old woman with a 2-year history of recurrent infections presented with foreign body sensation, itching, and red eye. Eye examination revealed meibomian gland dysfunction, cylindrical dandruff, and lid margin telangiectasia (Fig 1A). A clinical diagnosis of demodecosis was confirmed by eyelash epilation and fluorescein 0.25% dye. Massive infestation was found (Fig 1B, eyelash follicle [arrow], adult mites [asterisks]), and cluster formations detected (Fig 1C and D, mouth [red arrow], legs [black arrows]). Photographs were taken through a light microscope (original magnification ×40) with a smartphone. The patient was treated with ivermectin cream 1%. No mites were found after treatment (Magnified version of Fig 1A-D available online at www.aaojournal.org).
